
IMD0033 - Probabilidade

Lesson 24 - The Weighted Mean and the Median

Ivanovitch Silva

December, 2018

Agenda

- Different weights
- The weighted mean
- The median for open-ended distributions
- Computer the median
- The median as a resistant statistic
- The median for ordinal scales
- Sensitivity to changes

Introduction

	Order	PID	MS SubClass	MS Zoning	Lot Frontage	Lot Area	Street	Alley	Lot Shape	Mo Sold	Yr Sold	Sale Type	Sale Condition	SalePrice
0	1	526301100	20	RL	141.0	131770	Pave	NaN	0	5	2010	WD	Normal	215000
1	2	526350040	20	RH	80.0	11622	Pave	NaN	0	6	2010	WD	Normal	105000
2	3	526351010	20	RL	81.0	14267	Pave	NaN	12500	6	2010	WD	Normal	172000
3	4	526353030	20	RL	93.0	11160	Pave	NaN	0	4	2010	WD	Normal	244000
4	5	527105010	60	RL	74.0	13830	Pave	NaN	0	3	2010	WD	Normal	189900

	Year	Mean Price	Houses Sold
0	2006	181761.648000	625
1	2007	185138.207493	694
2	2008	178841.750804	622
3	2009	181404.567901	648
4	2010	172597.598240	341

```
1 mean_new = houses_per_year['Mean_Price'].mean()
2 mean_original = houses['SalePrice'].mean()
3 print("SalePrice mean:", mean_original)
4 print("Mean_Price mean:", mean_new)
```

```
SalePrice mean: 180796.0600682594
Mean_Price mean: 179948.75448767154
```

Different Weights

$$2009 : [28\ 700, 142\ 500, 440\ 000, 336\ 860, 207\ 500]$$

$$2010 : [135\ 000, 139\ 000]$$

$$\bar{x} = \frac{\overbrace{(28\ 700 + 142\ 500 + 440\ 000 + 336\ 860 + 207\ 500)}^{2009} + \overbrace{(135\ 000 + 139\ 000)}^{2010}}{7}$$

$$\bar{x} = \frac{\overbrace{1\ 413\ 860}^{2009} + \overbrace{274\ 000}^{2010}}{7} = 241122.86$$

Different Weights

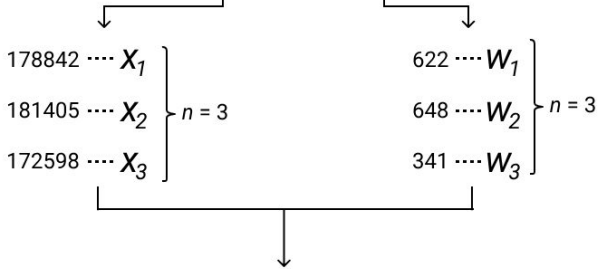
$$2009: \quad \bar{x} = \frac{28\,700 + 142\,500 + 440\,000 + 336\,860 + 207\,500}{5} = 282\,772$$

$$2010: \quad \bar{x} = \frac{135\,000 + 139\,000}{2} = 137\,000$$

$$overall\ mean: \quad \bar{x} = \frac{282\,772 + 137\,000}{2} = 209\,886$$

The Weighted Mean

Year	Mean Price	Houses Sold
2008	178842	622
2009	181405	648
2010	172598	341



$$\text{weighted mean} = \frac{X_1 W_1 + X_2 W_2 + \ldots + X_n W_n}{W_1 + W_2 + \ldots + W_n}$$

$$\text{weighted mean} = \frac{178842 * 622 + 181405 * 648 + 172598 * 341}{622 + 648 + 341} = 178551$$

```python
def weighted_mean(distribution, weights):
    weighted_sum = []
    for mean, weight in zip(distribution, weights):
        weighted_sum.append(mean * weight)

    return sum(weighted_sum) / sum(weights)

weighted_mean_function = weighted_mean(houses_per_year['Mean_Price'],
                                       houses_per_year['Houses_Sold'])

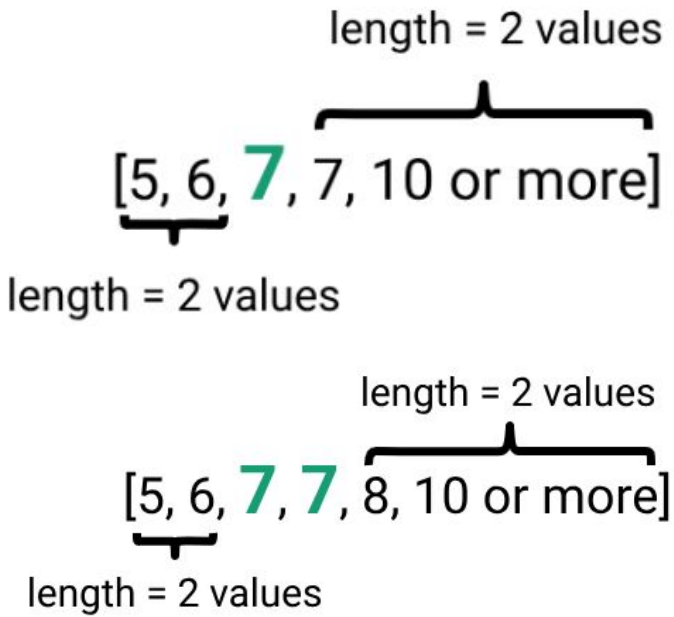
from numpy import average
weighted_mean_numpy = average(houses_per_year['Mean_Price'],
        weights = houses_per_year['Houses_Sold'])

print(round(weighted_mean_function, 10) == round(weighted_mean_numpy, 10))
```

The Median for Open-ended Distributions

```
1 houses['TotRms AbvGrd'].value_counts()
```

```
6              844
7              649
5              586
8              347
4              203
9              143
10 or more     131
3               26
2                1
```



Computer the median

```
distribution1 = [23, 24, 22, '20 years or lower,', 23, 42, 35]
distribution2 = [55, 38, 123, 40, 71]
distribution3 = [45, 22, 7, '5 books or lower', 32, 65, '100 books or more']
```

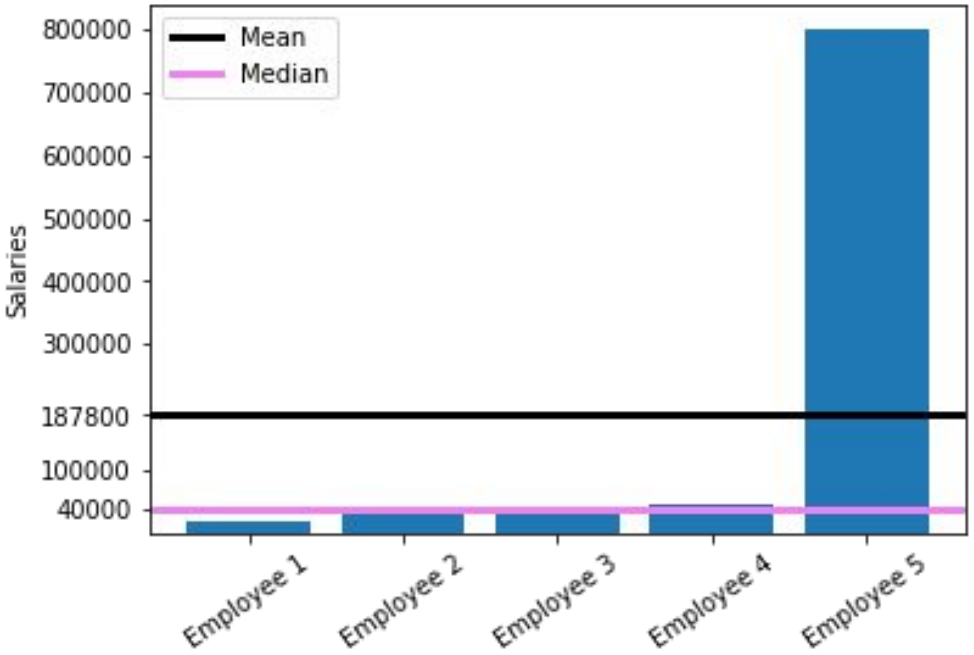
Computer the median

```
# Sort the values
rooms = houses['TotRms AbvGrd'].copy()
rooms = rooms.replace({'10 or more': 10})
rooms = rooms.astype(int)
rooms_sorted = rooms.sort_values()

# Find the median
middle_indices = [int((len(rooms_sorted) / 2)),
                  int((len(rooms_sorted) / 2 + 1))
                 ]
middle_values = rooms_sorted.iloc[middle_indices]
median = middle_values.mean()
print(middle_values)
print(median)
```

```
953     6
2264    6
Name: TotRms AbvGrd, dtype: int64
6.0
```

The median as a resistant statistic



[20000, 34000, 40000, 45000, 800000]

The median ideal for finding reasonable averages for distributions containing outliers.

The Median for Ordinal Scales

```
houses['Overall Cond'].value_counts().sort_index()
```

```
1       7
2      10
3      50
4     101
5    1654
6     533
7     390
8     144
9      41
```

If the overall condition of a house is rated with an 8 (Very good), and another house gets a 4 (Below average), we can't say that the conditions of the former are twice as better than the latter.

Code	Quality
1	Very poor
2	Poor
3	Fair
4	Below average
5	Average
6	Above average
7	Good
8	Very good
9	Excellent
10	Very excellent

Sensitivity to Changes

Code	Answer
1	Strongly disagree
2	Disagree
3	Neither agree nor disagree
4	Agree
5	Strongly agree

mean, median = 2

$$[1, 1, 1, 2, 2, 2, 2, 3, 3, 3]$$

$$[1, 2, 2, 2, 2, 2, 4, 5, 5, 5]$$

mean = 3
median = 2

Next Steps

- We continue the discussion about finding averages for ordinal data and also learn new things, like finding the average value for nominal variables.
